A flow of a commodity is said to be confluent if at any node all the flow of the commodity leaves along a single edge. In this article, we study single-commodity confluent flow problems, where we need to route given node demands to a single destination ...

Keywords: Approximation algorithms, confluent flow, network flow, routing, tight bounds

We present ongoing research that applies statistical relational learning techniques, in particular, propositionalization, to the challenging and interesting real-world domain of functional gene classification of the Yeast genome *Sachharomyces Cerevisiae*. ...

Graph database models can be defined as those in which data structures for the schema and instances are modeled as graphs or generalizations of them, and data manipulation is expressed by graph-oriented operations and type constructors. These models ...

Keyw ords: Database systems, database models, graph database models, graph databases, graph integrity constraints, graph query languages
